# Interoperabilitet

Syntaktisk

**IEEE**

Member of ISO/IEC/IEEE WD 21451-1-4

Standard for a Smart Transducer Interface for Sensors, Actuators, and Devices  
- eXtensible Messaging and Presence Protocol (XMPP) for Networked Device  
Communication.

IoT Special  
Interest  
Group

**XMPP**

# Why XMPP

## **Open**

The XMPP protocols are free, open, public, and easily understandable.

## **Standard**

The Internet Engineering Task Force (IETF) has formalized the core XML streaming protocols as an approved instant messaging and presence technology.

## **Proven**

The first Jabber/XMPP technologies were developed by Jeremie Miller in 1998.

## **Decentralized**

The architecture of the XMPP network is similar to email. No single point of failure. No central master server.

## **Secure**

Robust security using SASL and TLS has been built into the core XMPP specifications. The XMPP developer community is actively working on end-to-end encryption to raise the security bar even further.

## **Extensible**

Anyone can build custom functionality on top of the core protocols; to maintain interoperability, common extensions are published in the XEP series.

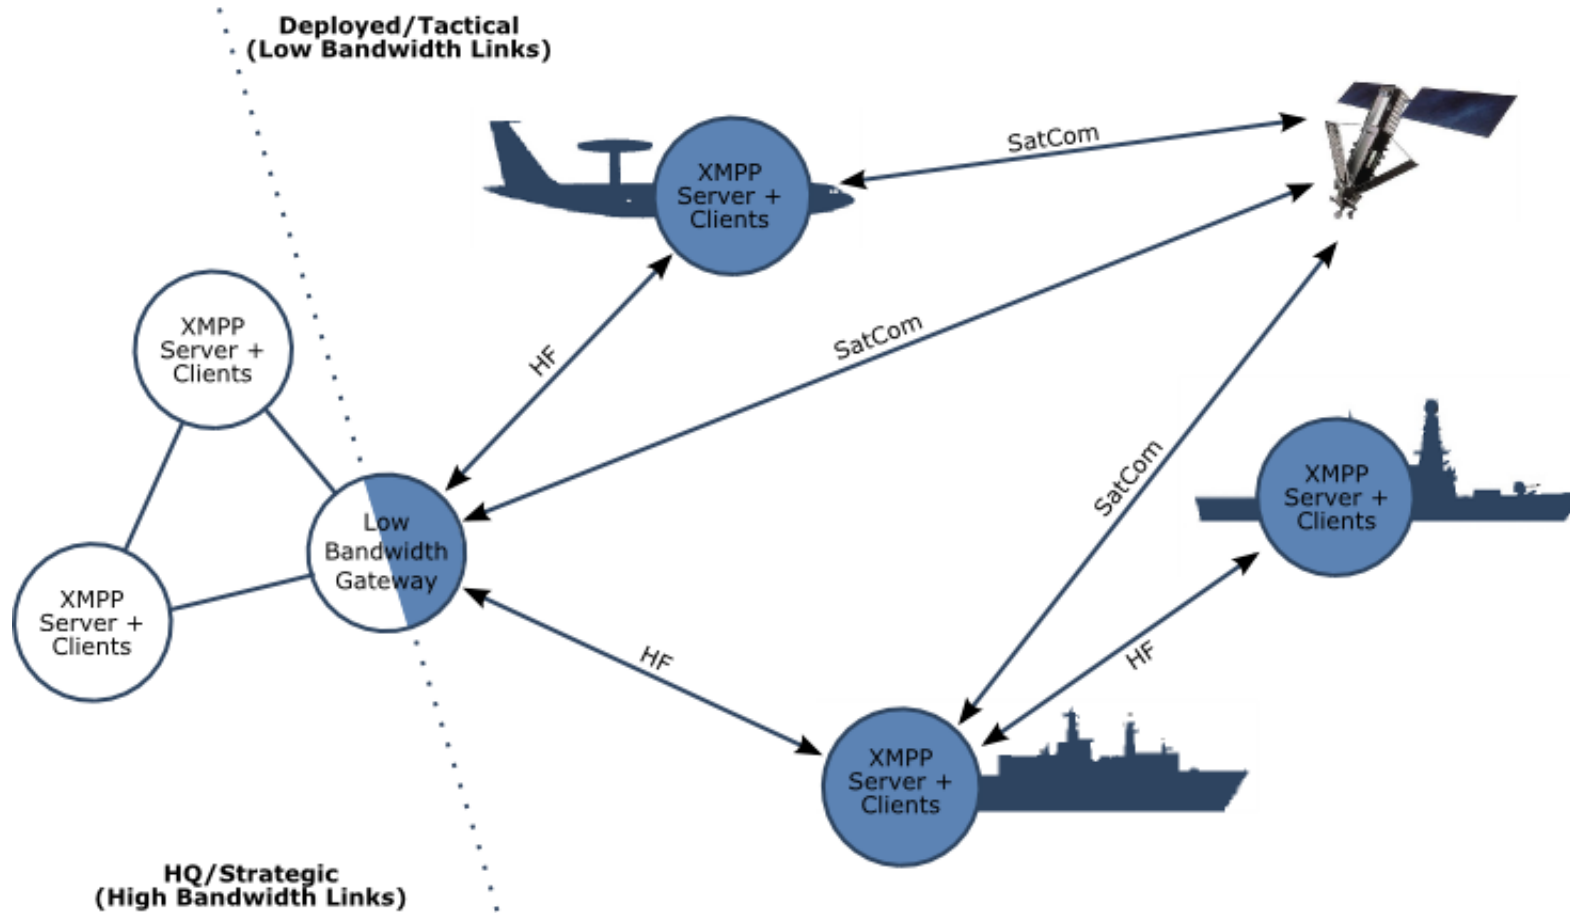

“WhatsApp uses a customized version of the open standard eXtensible Messaging and Presence Protocol (XMPP)”

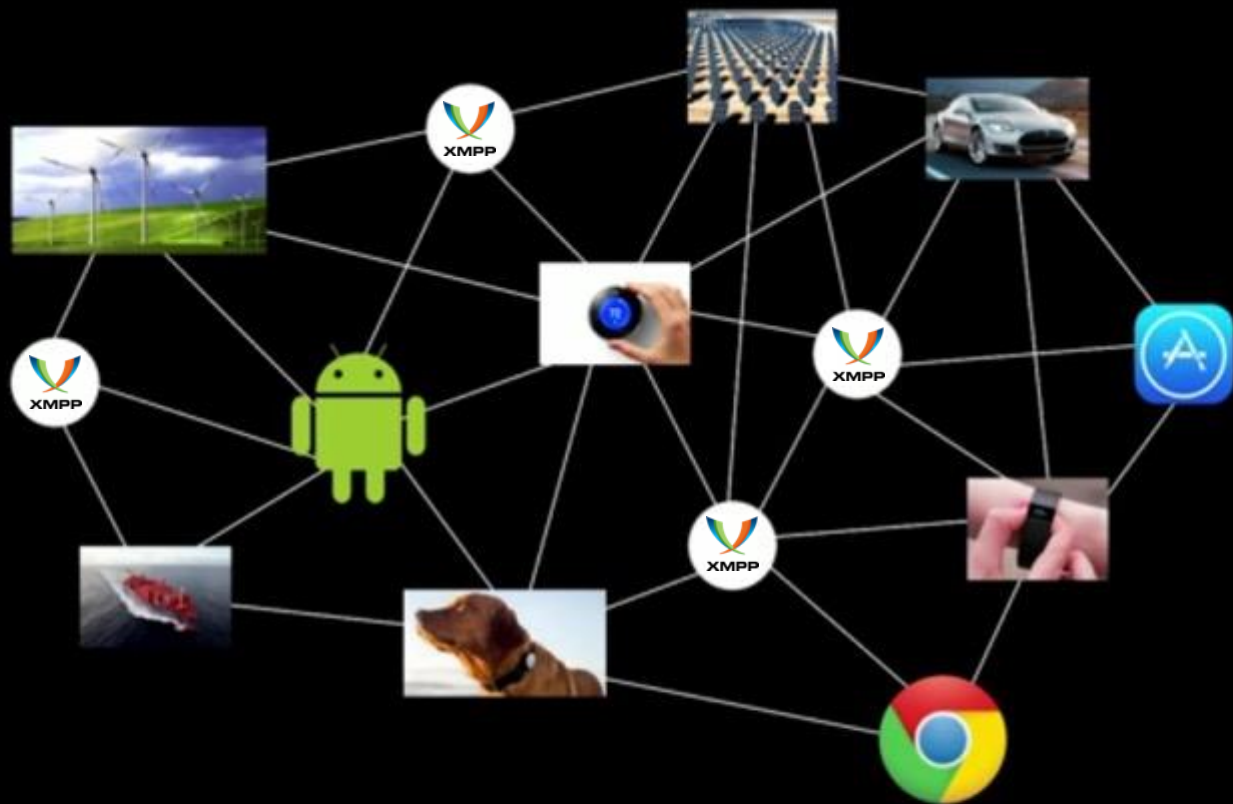

– Wikipedia

“It supports over 800 million active users and 30 billion messages daily and is an iconic example of a reliable and scalable messaging solution.”

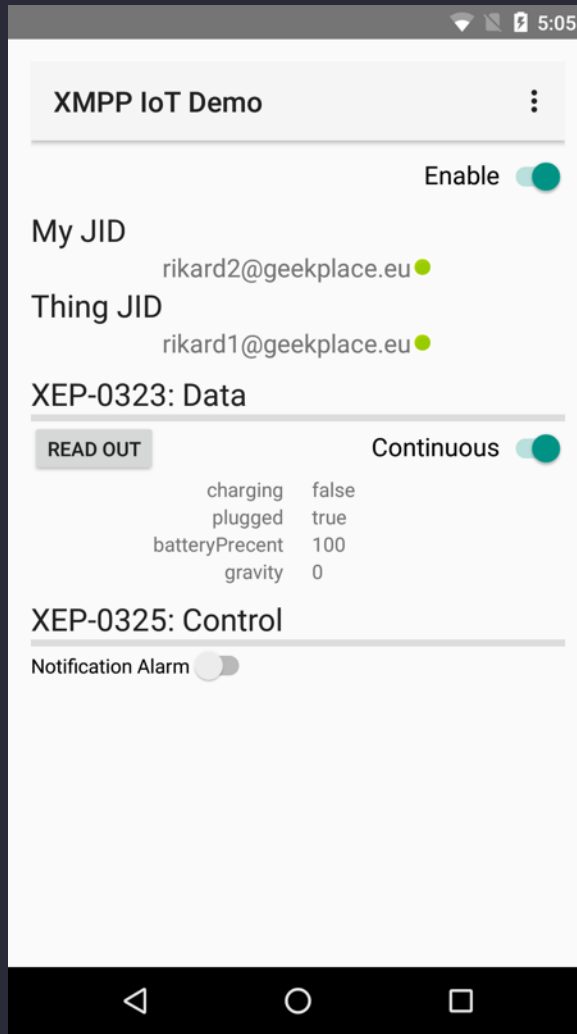

– Erlang Solutions

## F Support for IoT XEPs added to Smack

Posted by Flow in Ignite Realtime Blog on Jul 23, 2016 6:52:50 AM

Starting with [b91978dcc4ae](#) partial support for the IoT XEPs was added to Smack. The XEPs consists, amongst other XEPs, of

- XEP-0323: Data
- XEP-0324: Provisioning
- XEP-0325: Control
- XEP-0347: Discovery

The XEPs are in experimental state, which means changes to them are possible.

Smack does currently only support a partial set of the mechanisms specified, especially when it comes to Data and Control. For example only boolean and integer values can be read and written But support for more data types can be easily added.

The IoT API for those XEPs is available in the latest snapshot builds of Smack, which are available via [Maven Central's snapshot repository](#). A quick start guide can be found [here](#).

The development of the API was sponsored by [Clayster](#).

Clayster creates technology to secure trust in the transactions between physical and digital entities, and strives to be that generic foundation for your physical assets digital life.

Clayster has an IoT discovery and provisioning platform supporting XEP-0347 and XEP-0324. The platform is available for those who are interested to explore XMPP and IoT further. If you don't want to run your own infrastructure, Clayster is able to provide an XMPP Server and the discovery/provisioning platform for you. Feel free to reach out to rikard at clayster.com if you are interested to learn more about using XMPP for your next IoT project.
